1. Programming Languages (5 points)

C# in the backend scripting, it is what works for the unity engine

2. Platforms, APIs, Databases, and other technologies used (5 points)

Unity editor 6000.3.9f1 for the main bulk of programming, github desktop for easy repo management.

3. Execution-based Functional Testing (10 points)

There isn't really a clear and concise method we are using for testing, mostly just testing each feature bit by bit during implementation then doing broad testing across the feature once complete.

4. Execution-based Non-Functional Testing (10 points)

So far there hasn't been consideration for non functional testing except for focusing on back end features first.

5. Non-Execution-based Testing (10 points)

Non-execution-based testing was not really done in this increment.
